

**The Antarctic Glaciological Data Center provides support for NSF
Antarctic Program Principal Investigators to share their snow, ice and
related data**

Sarah Tressel, T. Scambos, R. Bauer

Antarctic Glaciological Data Center

Data collected as part of an Antarctic field research project may have more than one story to tell. The data may take on new life years or even decades later, as new scientific uses for the data arise. In the changing ice, climate and ocean global system, data collected today become the foundation of change detection measurement tomorrow.

Antarctic Glaciological Data Center (AGDC) staff works closely with Principal Investigators funded by the National Science Foundation (NSF) Office of Polar Programs (OPP) Antarctic Glaciology and other Antarctic programs to quickly and easily make their data available to the scientific community.

The AGDC Web site and associated activities promote new data sets to the community for the benefit of ongoing and future research. AGDC data collections are widely used by researchers, and AGDC has a data citation policy that benefits the contributing Principal Investigators.

We invite you and your colleagues to participate with AGDC in preserving your data and fulfilling the NSF OPP data-sharing requirements.
